Landscape Management Service

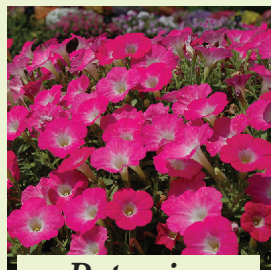

Spring Newsletter

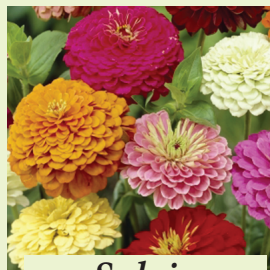

Now that the warmer weather has finally arrived, it's time for planting. Let us help you determine which flowers will grow best in your area. There are so many beautiful choices! Call today to schedule an appointment.

Begonia

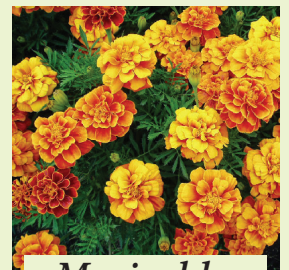

Petunia

Salvia

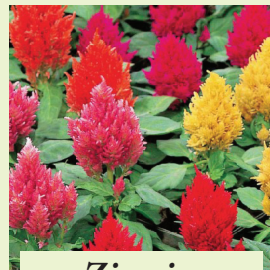

Celosia

Marigolds

New Guinea

Zinnia

Watering newly seeded areas require different care than established lawns. Follow these recommendations.

- Irrigate the area; you should try to maintain a consistently moist (but not saturated) soil.
- Grass will germinate and grow more vigorously in aeration holes or slits.
- Keep traffic, including children and pets, off of the lawn as much as possible, until the lawn has been mowed a few times and the new grass begins to mature.

Crabgrass Control is the next key factor in improving your lawn. Successful control increases with "Prevention." Preventive action gives your lawns the best fight against the clumpy, coarse-textured, all-around unsightly weed.

Applying a **Pre-Emergent Herbicide** to your lawn, will stop the crabgrass from emerging by inhibiting seed germination in the soil.

Regular fertilization, a good watering regiment, proper mowing, and pest control is the proper way to prevent crabgrass seed from growing. If adequate care is given to your soil, it will less likely be marred by crabgrass.
